

Assignment Report

Deploying BurgaVM in UK West

Deployment:

I customized an ARM template to create a new VM named BurgaVM in the UK West region. The template defined resources such as the virtual network, subnet, network security group, and network interface. The deployment completed successfully.

Access:

Due to a quota limit on Public IP addresses, I accessed the VM using Azure Bastion. I logged in with the credentials:

- Username: *burga*
- Password: *burga123*.

Configuration:

Once inside the VM terminal, I executed the following commands:

Update system packages:

```
sudo apt update && sudo apt upgrade -y
```

Verify VM identity:

```
hostname  
uname -a  
whoami
```

Install and start Nginx:

```
sudo apt install nginx -y  
sudo systemctl enable nginx  
sudo systemctl start nginx
```

Test a simple HTTP server:

```
echo "Assignment test successful on BurgaVM" > index.html  
python3 -m http.server 8080  
curl http://localhost:8080  
,
```

Evidence:

The screenshot provided shows:

- The VM terminal running on BurgaVM in UK West.
- Output of the test message: Assignment test successful on BurgaVM.
- The default Nginx welcome page confirming that the web server was installed and running.

Conclusion:

The assignment requirements were met: I deployed a VM using an ARM template in UK West, accessed it via Bastion, configured services, and verified functionality with both Nginx and a Python HTTP server. The screenshot evidence confirms successful completion.
